## Algebra II

## Sequence & Series Packet

Contents include notes, examples, and practice test (& solutions)

#### Sequences and Series

#### Sequence

What is it? A list of numbers (set apart by commas) that often have a pattern.

The following are common examples:

Arithmetic: Each term is separated by a "common difference"

Geometric: Each term is separated by the same factor or "common ratio"

And special sequences,

Fibonacci: Each term is the sum of the previous 2 terms

Square Numbers: Each term is the "square of that position"

Cube Numbers: Each term is the "cube of that position"

Triangle Numbers: 'Dots in a triangle' -- 1, 3, 6, 10, 15, 21, 28

. . . . . . . . . (adding a row each time)

Identify the pattern and find the missing term.

(Answers on the next page)

Identify the pattern and find the missing term.

Geometric sequence: common ratio is -2 (multiply by -2 each time)

Square number sequence (plus 3) (or, add 3, add 5, add 7, add 9, etc...)

'Fibonacci' sequence

$$(4+7=11 \quad 7+11=18 \quad 11+18=29 \quad \text{etc...})$$

Formula to find the n th term in an arithmetic sequence

$$a_n = a_1 + (n-1)a_1$$

 $\boldsymbol{a}_n = \boldsymbol{a}_1 + (n-1)d \qquad \qquad \boldsymbol{a}_1 \text{ is the first term of the sequence}$ d is the common difference

example: first term is 15; common difference is 6... Find the 8th term.

$$t_8 = 15 + (8 - 1)6 = 57$$

There are 7 moves from the 1st term to the 8th

Each move is 6 spaces...

 $7 \times 6 = 42$  spaces from the starting point...

$$15 + 42 = 57$$

example: (Arithmetic sequence) fourth term is 38; common difference is 5.. Find the 12th term..

In this case we are given the 4th term (instead of the 1st term). So, we will solve intuitively..

How many moves from the 4th term to the 12th term? 8 moves How many spaces is each move? 5 (the common difference)

Total spaces from the starting point?  $5 \times 8 = 40$ 

Therefore, the 12th term is 38 + 40 = 78

#### Exercises:

- 1) The arithmetic sequence is 28, 25, 22, ...
  - a) Find the 5th term
  - b) Find terms 200 and 201
  - c) 1 is a term in this sequence. Which is it?
- 2) In an arithmetic sequence, the 7th term is 32 and the common difference is -5.
  - a) What is the first term in the sequence?
  - b) Is -23 a term in this sequence? If so, which term?

(answers on following page)

#### Exercises:

- 1) The arithmetic sequence is 28, 25, 22, ...
  - a) Find the 5th term
  - b) Find terms 200 and 201
  - c) 1 is a term in this sequence. Which is it?
- 2) In an arithmetic sequence, the 7th term is 32 and the common difference is -5.
  - a) What is the first term in the sequence?
  - b) Is -23 a term in this sequence? If so, which term?

1) 28, 25, 22...

 $\mathbf{a}_{\mathbf{n}} = \mathbf{a}_{1} + (\mathbf{n} - 1)\mathbf{d}$ 

- a) 28, 25, 22, 19, 16, ...
- b) Using the formula:  $a_{200} = 28 + (200 1)(-3)$

(And, the 201st term is -572)

c) 
$$1 = 28 + (n-1)(-3)$$
  $-27 = (n-1)(-3)$   
 $9 = n-1$ 

2) a) 
$$a_7 = a_1 + (7 - 1)(-5)$$

$$32 = a_1 + (-30)$$

62, 57, 52, 47, 42, 37, 32, ...

$$62 = a_1$$

b) 62 - (-23) = 85.. Since 85 is a multiple of -5, it is in the sequence.

$$-23 = 62 + (n - 1)(-5) \longrightarrow n = 18$$

Formula to find the nth term in a geometric sequence:

$$a_n = a_1 \cdot r^{n-1}$$

a<sub>1</sub> is the first term

r is the common ratio

Example:

The geometric sequence has a first term of 2000; common ratio: .8

Find the 2nd and 3rd terms: 2000, (2000 x .8), (2000 x .8)(.8), ((2000 x .8)(.8))(.8), etc.. 2000, 1600, 1280, 1024, etc...

Find the 25th term: (using the formula)  $a_{25} = 2000 \cdot (.8)^{24} = 9.444733$ 

 $268.435 = 2000 \cdot (.8)^{n-1}$ 268.435 is a term in the sequence. Which is it?

 $..13422 = (.8)^{n-1}$  (using logarithms) n = 10

Series

What is it? The sum of the terms of a sequence.

$$S_7 = 6 + 3 + 0 + (-3) + (-6) + (-9) + (-12) = -21$$

$$S_5 = 3 + 8 + 13 + 18 + 23 = 65$$

Arithmetic Series Formula:

$$S_n = \frac{n(a_1 + a_n)}{2}$$

Example: Find the sum of the first 20 terms of the following arithmetic

$$a_n = 4 + 6n$$

First term: 
$$a_1 = 10$$
  
20th term:  $a_{20} = 124$   $S_{20} = \frac{20(10 + 124)}{2} = 1340$ 

10 pairs x 134/pair = 1340

Examine the patterns:

1st term + 20th term = 10 + 124 = 134

2nd term + 19th term = 16 + 118 = 134

3rd term + 18th term = 22 + 112 = 134

So, each pair is 134...

How many pairs? 20/2 = 10 pairs

#### Geometric Series Formula:

$$S_n = \frac{a_1(1-r^n)}{1-r}$$

Example: Find the 8th partial sum of a geometric series of first term 3 and common ratio 2.

The sum will be 3 + 6 + 12 + 24 + 48 + 96 + 192 + 384(The first term is 3; every term is 2x the previous)

Using the formula on the left, the 8th partial sum is

$$S_8 = \frac{3(1-2^8)}{1-2} = \frac{3(1-256)}{-1} = 765$$

#### Infinite Series

What is it? A series that has no last term. Since it has no ending, there is no definite value for an infinite series. However, there may be a limit.

#### Convergence and Divergence:

If the series has a limit, then it converges. If the series has no limit, then it diverges.

All arithmetic series diverge.

Example: 
$$2+5+8+11+...$$
 goes to infinity...  $S_{\infty}=\infty$   $-1/2+(-1)+(-3/2)+(-2)+...$  goes to negative infinity...  $S_{\infty}=-\infty$ 

Some geometric series converge. If r is the common ratio, and if

 $\mid r \mid \leq 1,$  then the geometric series converges (to a limit)

Example: 1+3+9+27+... common ratio: 3 (greater than 1; diverges) 2+(-4)+8+(-16)+32+(-64)+... common ratio: -2 (since |-2|>1, the series diverges)

(note: if you pair the numbers, the series is 2+4+16+64+... and obviously diverges)

#### Infinite Geometric Series

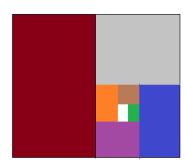

$$3 + 1 + 1/3 + 1/9 + 1/27 + ...$$
 common ratio: 1/3 (less than 1; converges)

$$S_{\infty} = \frac{a_1}{1-r}$$

Using the formula, 
$$S_{\infty} = \frac{3}{(1-1/3)} = \frac{9}{2} = 4\frac{1}{2}$$

(note: 3 + 1 + 1/3 + 1/9 + ... will end at some point, because (1/3)n approaches 0 as n gets larger and larger.. Therefore, the series will approach a specific value as the terms get closer to 0.)

#### Geometric series illustration:

$$\frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \frac{1}{16} + \frac{1}{32} + \frac{1}{64} + \frac{1}{128} + \dots = 1$$

The geometric ratio is 1/2...

The first term is 1/2

$$S_{\infty} = \frac{1/2}{1 - 1/2} = 1$$

\*\* Note: the multi-color box illustrates the infinite series is approaching 1

#### More topics, applications, and examples of Sequences and Series:

I. Using Geometric Series to express repeating decimals..

Convert .2121 to a rational expression.

Let 
$$n = .21\overline{21}$$
  
Then  $100n = 21.21\overline{21}$ 

$$\begin{array}{ccc}
 & 100n & 21.21\overline{21} \\
 & - & n & - .21\overline{21} \\
\hline
 & 99n & 21
\end{array}$$

21.21
$$\overline{21}$$
 99n = 21  
- .21 $\overline{21}$  So, n =  $\frac{21}{99}$ 

2) geometric series 
$$.21 + .0021 + .000021 + ...$$
  $S_n = .21(.01)^{n-1}$ 

$$S_{\infty} = \frac{.21}{(1 - .01)} = \frac{.21}{.99} = \frac{.21}{.99}$$

#### II. Applications of geometric sequences and series (word problem):

A tree grows 40 inches its first year. It grows 38 inches the second year.

Assuming a geometric rate of growth,

- a) how much will it grow the 5th year?
- b) How tall will it be after 10 years?
- c) What will its ultimate height be?

find geometric ratio: 38/40 = .95

$$T_1 = 40$$

$$T_2 = 38$$

$$T_5 = 40(.95)^4 = 32.58$$

$$S_{10} = \frac{40(1 - .95^{10})}{(1 - .95)} = \frac{.401}{.05}$$
 321 inches

Ultimate height: 
$$\frac{40}{(1-.95)}$$
 = 800 inches

#### III. Explicit vs. Recursive formulas

Explicit formulas use direct calculation and simply require the term..

Recursive formulas require the 1st term of the sequence and the computation of previous terms.

Explicit formula: 
$$a_n = 5n$$

Using the explicit form, you find the 10th term by calculating 5(10)

Recursive formula: 
$$a_1 = 5$$
  
 $a_n = a_{n-1} + 5$ 

Using the recursive formula, the 10th term is found by adding 5 to the 9th term..

Example: 4, 12, 36, 108, ...

Explicit formula: 
$$a_n = 4 \cdot 3^{n-1}$$

Recursive formula: 
$$a_1 = 4$$

$$a_n = 3 \cdot a_{n-1}$$

Each term is 3 times the previous the term.

Recursive formulas are useful in 'Fibonacci' type sequences..

Example: 2, 3, 5, 8, 13, 21, ...

$$a_1 = 2$$

$$a_2 = 3$$

$$\mathbf{a_n} = \mathbf{a_{n-1}} + \mathbf{a_{n-2}}$$

There is no explicit formula to express this sequence pattern.

Example: Determine the interval of convergence of the following series.

$$S_{n} = \left(\frac{x+2}{5}\right)^{n}$$

What values of x will make this series converge? Since -1 < r < 1, find the range of x values that will keep the common ratio less than 1.

$$-1 < \left(\frac{x+2}{5}\right) < 1$$
$$-7 < x < 3$$

(-7, 3) is the interval of convergence. If x is between -7 and 3, then the geometric series will converge to a specific value.

#### V. Sequence vs. Series

Example Write the 1st 4 terms of the following:

- a) arithmetic sequence w/1st term 10 and common difference 2 (terms separated by commas) 10, 12, 14, 16
- b) geometric series w/1st term 3 and common ratio 3 3+9+27+81(terms added together)

#### VI. Arithmetic and Geometric Means

Arithmetic mean:

What is it? The average of two numbers; The middle of terms in a sequence. Arithmetic mean of 10 and 16: 13 (10 + 16)/2 = 13To find the arithmetic mean of 2 terms, add them and divide by 2. 10, 13, 16 common difference: 3

Geometric mean:

Geometric mean of 2 and 8:  $\sqrt{16} = 4$ What is it? A type of average; The middle of terms in a geometric sequence.  $2 \times 2 = 4$   $4 \times 2 = 8$ To find the geometric mean of 2 terms, multiply them and take the square root. 2, 4, 8 common ratio: 2

Example:  $T_3 = 4$   $T_5 = 16$  What is the mean  $(T_4)$ ? The arithmetic mean is 10. The geometric mean is 8. Note: You must specify the type of sequence!

"multiple means"

Insert 3 geometric means between 2 and 32.. includes imaginary numbers! 2, 4, 8, 16, 32 2, -4, 8, -16, 32 2, 4i, -8, 16i, 32 2, -4i, 8, -16i, 32  $\frac{22 - 7}{3} = 5$  7, (7 + 5), (7 + 5 + 5), 22 7, [12, 17], 22 Insert 2 arithmetic means between 7 and 22

VII. Summation and sigma notation:

$$\sum_{i=1}^{n} c = nc$$

$$\sum_{i=1}^{n} x + y = \sum_{i=1}^{n} x + \sum_{i=1}^{n} y$$

$$\sum_{i=1}^{n} i = \frac{n(n+1)}{2}$$
Example: Find 
$$\sum_{i=1}^{10} 3n + 6$$

$$\sum_{i=1}^{10} 3n + \sum_{i=1}^{10} 6$$

$$3 \sum_{i=1}^{10} n = 3 \left( \frac{10(11)}{2} \right) = 165$$

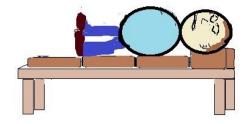

$$\sum_{i=1}^{10} 6 = 10(6) = 60$$

$$165 + 60 = 225$$

Mr. Octoman simply lies down.

L. Friedman #21 3-4-12 www.mathplane.com

## SEQUENCE AND SERIES PRACTICE TEST

#### Sequences & Series Test

#### I. Sequence Patterns

- A. Add 2 terms to each of the following:
  - 1) 6, 12, 20, 30, 42, 56,
  - 2) 3, -6, 12, -24, 48,
  - 3)  $\frac{1}{4}$ ,  $\frac{3}{4}$ ,  $\frac{5}{4}$ ,  $\frac{7}{4}$ ,
  - 4) 2, 3, 5, 8, 13, 21,
- B. Identify the sequences (geometric, arithmetic, or neither); Give the common ratio or difference, (if one exists).
  - 1) 3, -9, 27, -81, ...

sequence type:

common ratio/difference:

2) 2, 7, 9, 16, 25, ...

sequence type:

common ratio/difference:

3)  $\frac{1}{3}$ ,  $\frac{5}{6}$ ,  $\frac{4}{3}$ , 15/6...

sequence type: common ratio/difference:

#### II. Sequence Expressions

- A. Express the following in Explicit form and Recursive form.
  - 1) 3, 10, 17, 24, ...

2) 32, 16, 8, 4, 2, ...

(arithmetic) (geometric)

Explicit Form:

Explicit Form:

Recursive Form:

Recursive Form:

- B) Answer the questions; then, write expressions to describe each sequence.
  - 1) Arithmetic;  $T_4 = 28$   $T_{10} = 58$

2) Geometric;  $T_3 = \frac{1}{8}$   $T_6 = \frac{1}{64}$ 

What is T<sub>1</sub>?

What is T<sub>1</sub> ?

T ...?

What is the common difference of the sequence?

What is the common ratio of the sequence?

 $T_n =$ 

 $T_n =$ 

#### III. Series

#### A. Solve the following

1) Arithmetic; 1st term: 7 common difference: 4

$$S_6 =$$

2) Geometric; 1st term: 5 common ratio: 2

$$S_4 =$$

- B. Answer the following (using formulas)
  - 1) Find the 10th partial sum of the geometric series with 1st term 400 and common ratio .9
  - 2) Find the 40th partial sum of the following:

#### IV. Summations and Sigma Notation

A) Solve

1) 
$$\sum_{T=1}^{5} T^2 =$$

2) 
$$\sum_{X=1}^{20} 3X + 5 =$$

3) 
$$\sum_{m=3}^{7} 4m - 3 =$$

B) Describe the following series using sigma notation

#### V. Arithmetic and Geometric means

- A) Find the following
  - 1) 3 and 9 arithmetic mean:
  - 2) 3 and 48 all possible geometric means:

#### VI. Geometric Series: convergence/divergence

- A) Determine whether the following geometric series converge or diverge. then, find the limit of convergence (if it exists).
  - 1) 30 + 27 + ...
  - 2) 10 + 13 + ...
- B) Write  $.27\overline{27}$  as an infinite geometric series; Then, express  $.27\overline{27}$  as a fraction.
- C) What is the interval of convergence for the following geometric series?

$$\sum_{n=1}^{\infty} = \left\langle \frac{X-2}{3} \right\rangle^n$$

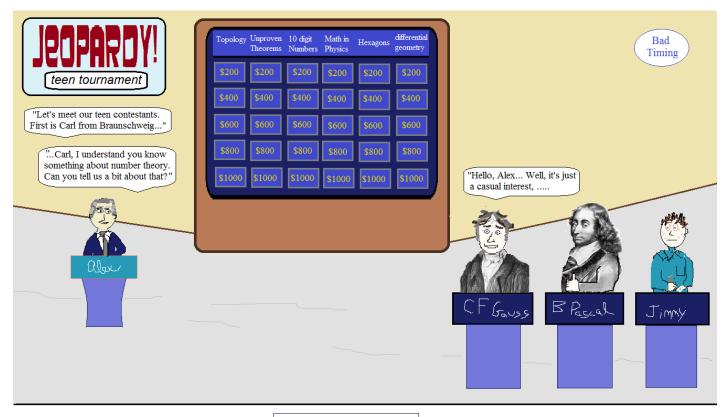

#### D) Answer the following:

1) Evaluate S  $_{\infty}$  for 1/2, 1/4, 1/8, 1/16, ...

2) 
$$\sum_{n=1}^{\infty} (1.001)^n =$$

$$3) \sum_{n=1}^{\infty} 3 - \left(\frac{2}{3}\right)^n =$$

4) 
$$\sum_{n=1}^{\infty} 3\left(\frac{2}{3}\right)^n =$$

Jimmy didn't have a chance...

L. Friedman #46 8-17-12 www.mathplane.com

# SEQUENCE AND SERIES ANSWERS

#### I. Sequence Patterns

- A. Add 2 terms to each of the following:
  - 1) 6, 12, 20, 30, 42, 56, 72, 90 (add 6, add 8, add 10, add 12, etc...)
  - 2) 3, -6, 12, -24, 48, -96, 192 (multiply by -2)
  - 3)  $\frac{1}{4}$ ,  $\frac{3}{4}$ ,  $\frac{5}{4}$ ,  $\frac{7}{4}$ ,  $\frac{9}{4}$ ,  $\frac{11}{4}$  (add 2/4)
  - 4) 2, 3, 5, 8, 13, 21, 34, 55 (Fibonacci sequence: each term is the sum of the previous two terms)
- B. Identify the sequences (geometric, arithmetic, or neither); Give the common ratio or difference, (if one exists).
  - 1) 3, -9, 27, -81, ... sequence type: geometric common ratio/difference: -3
  - 2) 2, 7, 9, 16, 25, ... sequence type: neither (each element is the sum of the previous two) common ratio/difference: none
  - 3)  $\frac{1}{3}$ ,  $\frac{5}{6}$ ,  $\frac{4}{3}$ , 1.5/6 ... sequence type: arithmetic common ratio/difference:  $\frac{1}{2}$

#### II. Sequence Expressions

- A. Express the following in Explicit form and Recursive form.
  - 1) 3, 10, 17, 24, ... (arithmetic)

2) 32, 16, 8, 4, 2, ... (geometric)

Explicit Form:

$$A_n = 3 + 7(n-1)$$

Recursive Form:

$$A_1 = 3$$
  
 $A_n = A_{n-1} + 7$ 

Explicit Form:

$$G_{n} = 32 \left(\frac{1}{2}\right)^{n-1}$$

Recursive Form:

$$G_1 = 32$$

$$G_n = G_{n-1} \left(\frac{1}{2}\right)$$

B) Answer the questions; then, write expressions to describe each sequence.

Asithmetic: 
$$T = 28$$
,  $T = 58$ 

1) Arithmetic; 
$$T_4 = 28$$
  $T_{10} = 58$ 

$$\frac{58-28}{(10-4)} = 5$$
 What is T<sub>1</sub>? T<sub>1</sub> = T<sub>4</sub> - 5(3) T<sub>1</sub> = 13  
T<sub>20</sub>? T<sub>20</sub> = T<sub>10</sub> + 5(10) T<sub>20</sub> = 108

What is the common difference of the sequence?

common difference: 5

$$T_n = 13 + 5(n-1)$$

2) Geometric; 
$$T_3 = \frac{1}{8}$$
  $T_6 = \frac{1}{64}$ 

What is 
$$T_1$$
?  $T_3 = (T_1)^3$ 

$$\frac{1}{8} = \sqrt{\frac{1}{2}}^{8}$$

(since T<sub>3</sub> and T<sub>6</sub> are 3 terms apart, we take the cube root of their quotient)

 $\frac{1}{64} \cdot \frac{1}{8} = \frac{1}{8}$ 

$$\lambda^{3} / \frac{1}{2} = 1/2$$

What is the common ratio of the sequence?

common ratio: 
$$\frac{1}{2}$$

$$T_{n} = \left(\frac{1}{2}\right)^{n}$$

#### III. Series

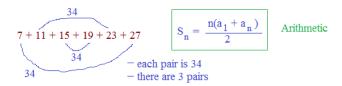

#### A. Solve the following

1) Arithmetic; 1st term: 7 common difference: 4

$$S_6 = 102$$

2) Geometric; 1st term: 5 common ratio: 2

$$S_4 = 75$$

$$5 + 10 + 20 + 40$$

$$= \frac{5(1-2^4)}{1-2} = \frac{-75}{-1} = 75$$

$$S_n = \frac{a_1 (1 - r^n)}{1 - r}$$
 Geometric

#### B. Answer the following (using formulas)

1) Find the 10th partial sum of the geometric series with 1st term 400 and common ratio .9

$$\frac{a_1 (1-r^n)}{1-r} = \frac{400 (1-.9^{10})}{1-.9} = \frac{260.5}{.1} = \boxed{2605}$$

2) Find the 40th partial sum of the following:

First term: 32 Common difference: 6 40th term: 32 + 6(39) = 266

$$\frac{n(a_1 + a_n)}{2} = \frac{40(32 + 266)}{2} = 20(298) = 5960$$

#### IV. Summations and Sigma Notation

#### A) Solve

1) 
$$\sum_{T=1}^{5} T^2 = 55$$

$$T_1 = 1$$
 $T_2 = 4$ 
 $1 + 4 + 9 + 16 + 25 = 55$ 

$$T_4 = 16$$

$$T_4 = 16$$

$$T_5 = 25$$

2) 
$$\sum_{X=1}^{20} 3X + 5 = 730$$

$$\sum_{X=1}^{20} 5 = 5(20) = 100$$

$$3\sum_{X=1}^{20} X = 3\left(\frac{20 \cdot 21}{2}\right) = 630$$

3) 
$$\sum_{m=3}^{7} 4m - 3 = 85$$

$$m_2 = 0$$

$$m_4 = 13 \quad 9 + 13 + 17 + 21 + 25 = 85$$

$$m_5 = 17$$

$$m_6 = 21$$

$$m_7 = 25$$

#### B) Describe the following series using sigma notation

$$\sum_{i=1}^{4} 4i$$

$$\sum_{k=1}^{5} 2 \cdot 3^{(k-1)}$$

#### Sequences & Series Test

#### V. Arithmetic and Geometric means

- A) Find the following
  - (common difference is 3) 1) 3 and 9 arithmetic mean:
  - 2) 3 and 48 all possible geometric means: (common ratio: 4) -12 (common ratio: -4)

#### VI. Geometric Series: convergence/divergence

A) Determine whether the following geometric series converge or diverge. then, find the limit of convergence (if it exists).

1) 
$$30 + 27 + ...$$
  $27 \div 30 = .9$  .9 is common ratio  $\frac{a}{1 - r} = \frac{30}{1 - .9} = 300$  Since  $.9 < 1$ , it does converge.

2) 
$$10 + 13 + ...$$
 The common ratio is 
$$1.3 \quad (10 \times 1.3 = 13) \quad \text{Since } 1.3 > 1 \text{, the series diverges...}$$

B) Write  $.27\overline{27}$  as an infinite geometric series; Then, express  $.27\overline{27}$  as a fraction.

$$27\overline{27} = .27 + .0027 + .000027 + ... \qquad \text{common ratio r} = .01 \qquad 100n = 27.27\overline{27} \\
\sum_{n=1}^{\infty} .27(.01)^{n-1} \qquad \frac{a}{1-r} = \frac{.27}{(1-.01)} = \frac{.27}{.99} = \boxed{\frac{27}{99}} \\
99n = 27$$

C) What is the interval of convergence for the following geometric series?

$$\sum_{n=1}^{\infty} = \left(\frac{X-2}{3}\right)^n \qquad \left|\frac{X-2}{3}\right| < 1 \qquad \frac{X-2}{3} < 1 \qquad \frac{X-2}{3} > -1$$

$$\left|\frac{X-2}{3}\right| < 1$$

$$\frac{X-2}{3} \le 1$$

$$X \le 5$$
 and

$$\frac{X-2}{3} > -1$$
$$X > -1$$

 $n = .27\overline{27}$ 

The interval of convergence for the series is  $-1 \le X \le 5$ 

(For the geometric series to converge, it must be less than 1)

- D) Answer the following:
  - 1) Evaluate S  $_{\infty}$  for 1/2, 1/4, 1/8, 1/16, ... common ratio = 1/2 Since it is less than 1, it

2) 
$$\sum_{n=1}^{\infty} (1.001)^n = \infty$$
 (because 1.001 > 1)

3) 
$$\sum_{n=1}^{\infty} 3 - \left(\frac{2}{3}\right)^n = \left[\infty\right]$$
 (although  $\left(\frac{2}{3}\right)^n$  will converge, 3 does not..)

4) 
$$\sum_{n=1}^{\infty} 3\left(\frac{2}{3}\right)^n = 3 \sum_{n=1}^{\infty} \left(\frac{2}{3}\right)^n = 3 \frac{2/3}{(1-2/3)} = 3 \times 2 = 6$$

$$\sum_{n=1}^{\infty} 3 \left(\frac{2}{3}\right)^n = 2 + 12/9 + 24/27 + 48/81 + \dots$$
(each term in the series is less than the previous term -- the series is converging)

### Thank you for downloading this packet...

Hope the notes and practice test were a helpful review!

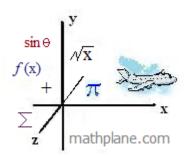

Questions, suggestions, or feedback is always appreciated...

Best always,

Lance

#### "Multiple Arithmetic and Geometric Means"

#### Example: Find the three arithmetic means between 15 and 43?

The space between 15 and 43 is 28 units...

Since we're looking for 3 arithmetic means, there will be 4 (common) differences in the 28 units...

28/4 = 7 (common difference)...

15 22 29 36 43

#### Example: Find the two geometric means between 20 and 160?

#### Interpretation 1:

Find the geometric mean between 20 and 160

$$160 \div 20 = 8 \longrightarrow \sqrt{8} = 2\sqrt{2}$$

$$2\sqrt{2} \text{ is the common ratio}$$

$$20 \quad 40\sqrt{2} \quad 160$$
OR
$$-2\sqrt{2} \text{ is the common ratio}$$

$$20 \quad -40\sqrt{2} \quad 160$$

#### Interpretation 2:

Insert 2 geometric means between 20 and 160

$$160 \div 20 = 8 \longrightarrow \sqrt[3]{8} = 2$$
2 is the common ratio
$$20 \quad 40 \quad 80 \quad 160$$

Example: Give 4 possible answers (including complex numbers):

three geometric means between 2 and 162.

2, 6, 18, 54, 162 common ratio: 3 
$$\frac{262}{2} = 81$$
2, -6, 18, -54, 162 common ratio: -3
2, 6i, -18, -54i, 162 common ratio: 3i
2, -6i, -18, 54i, 162 common ratio: -3i

$$\sum_{k=1}^{10} (k+1)^2$$

Method 1: Write out the terms (and seek pattern)

(perfect squares)

$$\sum_{k_{i}=0}^{n} k_{i} = \frac{n(n+1)}{2}$$

$$\sum_{k_{i}=0}^{n} k^{2} = \frac{n(n+1)(2n+1)}{6}$$

Method 2: Expand the term (and separate)

$$\sum_{k=1}^{10} k^2 + 2k + 1$$

$$\sum_{k=1}^{10} k^2 + 2 \sum_{k=1}^{10} k + \sum_{k=1}^{10} 1$$

$$\frac{(10)(11)(21)}{6} + 2(55) + 10(1) = 505$$

Example: Write the following series in sigma notation: -8 - 3 + 2 + 7 + ... + 62

$$\sum_{k=0}^{n} a_1 + dk \qquad \begin{array}{l} a = 1st \text{ value} \\ d = common \text{ difference} \\ n = number \text{ of terms} \end{array}$$

This is an arithmetic series

$$\frac{62 - (-8)}{5} = 14 (+1) = 15$$

This is an arithmetic series with common difference 5 (and, there are 15 terms) 
$$\frac{62 - (-8)}{5} = 14 \ (+1) = 15$$
 
$$\frac{14}{-8 + 5k} \quad \text{or} \quad \sum_{k=1}^{15} -8 + 5(k-1)$$

Example: Write the following series in sigma notation: 2 - 8 + 32 - 128 + ...

This is a geometric series with common ratio (-4) 
$$\sum_{k=1}^{\infty} 2 \cdot 4^{k-1} \qquad \text{or} \qquad 2^{2k-1}$$

Example: Evaluate

$$\sum_{n=0}^{20} \sqrt{2} n-7$$

$$\sqrt{2}\sum_{n=0}^{20} n - \sum_{n=0}^{20} 7$$

n = 0, 1st term = 0

21 terms x 7 = 147

$$\sqrt{2}$$
  $\sum_{n=1}^{20}$   $n = \sqrt{2} \frac{20(1+20)}{2} = 210\sqrt{2}$  Total:  $210\sqrt{2} - 147$ 

Total: 
$$210 \sqrt{2} - 147$$

Example: Find the common ratio of the sequence

$$5, 5^{7/6}, 5^{4/3}, 5^{3/2}, \dots$$

simply divide any term by its previous term...

$$\frac{5^{7/6}}{5^{6/6}} = 5^{1/6}$$

$$\frac{5^{7/6}}{5^{6/6}} = \boxed{5^{1/6}} \qquad \frac{5^{4/3}}{5^{7/6}} = \frac{5^{8/6}}{5^{7/6}} = \boxed{5^{1/6}}$$

#### Sequences and Series: Word Problems & Applications

Example: A rubber ball is dropped from 44 inches above the ground.

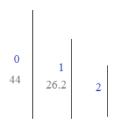

Each time it bounces, the ball retraces 60% of its previous height.

- a) What is the height of the ball after the 8th bounce?
- b) How far will the ball travel before it 'comes to rest'?

The height after a particular bounce can be expressed as

$$a_0 = 44$$
 $a_1 = 44 (.60) = 26.2 \text{ inches}$ 
 $a_n = 44(.60)^n$ 
 $a_2 = 44 (.60)(.60)$ 
 $a_8 = 44(.60)^8 = 0.739 \text{ cm above ground}$ 

$$S_{\infty} = \frac{a_1}{(1-r)}$$

The distance travel will be the sum of all the bounces (<u>up and down</u>). And, the number of bounces will be infinite...

distance traveled (going down): initial move: 44 cm..

$$S_{down} = \frac{44}{(1 - .60)} = 110 \text{ cm}$$

distance traveled (going up): inital move: 26.2 cm..

$$S_{up} = \frac{26.2}{(1 - .60)} = 65.5 \text{ cm}$$

Total distance traveled will approach 175.5 cm

Example: A bungee jumper leaps off a bridge and falls 200 feet before bouncing up 70%...

Then, the jumper falls again, before bouncing up 70%... This continues until the jumper settles.

- a) After 5 bounces, how far has the bungee jumper traveled?
- b) How far would the bungee jumper travel before stopping?

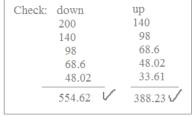

This is a geometric series: the first term is 200. and, the common ratio is .70 or  $\frac{7}{10}$ 

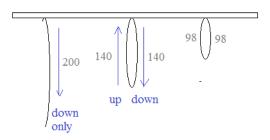

must add the downward sum AND the upward sum

$$\frac{S_{5}}{\text{down}} = \frac{200 (1 - .7^{5})}{1 - .7} = 554.62$$

$$\frac{S_{5}}{\text{up}} = \frac{140 (1 - .7^{5})}{1 - .7} = 388.23$$
Total after 5 bounces: 942.85 feet

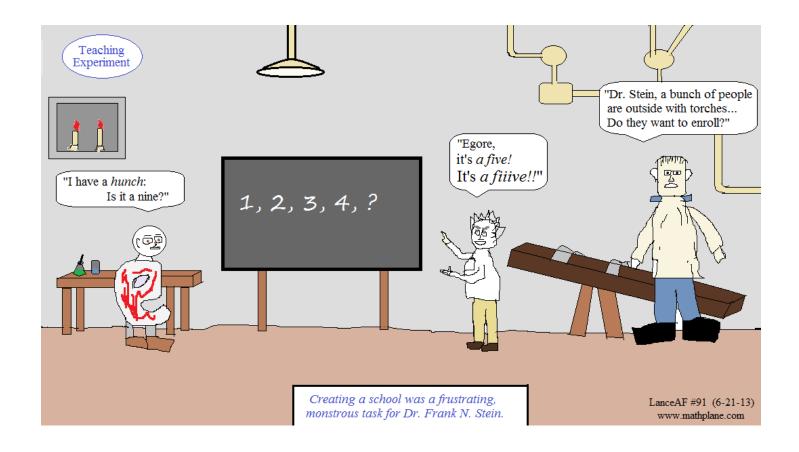

$$S_{\infty} = \frac{200}{(1 - .70)} = 666 \frac{2}{3}$$

$$S_{\infty} = \frac{140}{(1 - .70)} = 466 \frac{2}{3}$$

Total distance traveled will go to  $1133\frac{1}{3}$  feet

### Another Practice Test -→

#### Sequences & Series Test II

#### Part I: Sequences, Series, and Terms

- 1) Questions
  - a) What is the arithmetic mean between 10 and 20?
  - b) What is the geometric mean between 10 and 20?
- 2) Write the first 3 terms:
  - a) arithmetic series; 1st term: 50

common difference: 1.6

b) geometric sequence; 1st term: 13

common ratio: 4

- 3) In a geometric sequence,  $T_3 = 24$   $T_5 = 6$ 
  - a) What is T<sub>4</sub>?
  - b) What is another possible answer?
- Part II: Sums

Find sum: 1) 
$$6-3+\frac{3}{2}-\frac{3}{4}+...$$

(sigma notation)

3) 
$$\sum_{k=1}^{11} 15 \left(\frac{2}{3}\right)^k =$$

4) 
$$\sum_{k=0}^{20} 100 (1.08)^k =$$

5) Find the sum of multiples of 4 between 15 and 523.

6) Find the sum of all multiples of 7 including and between 7 and 98.

7) If the sum of the first 14 terms of arithmetic sequence is 301, and the first term is 2, what is the 4th term?

#### Sequences & Series Test II

Part III.	Word	Problems	& At	polications
I ait III.	WOIG	1 TOURING	$\alpha$	<i>pucauons</i>

1)	A tree grows geometrically. The first year growth was 40 inches. The second year growth was 38 inches.
	a) Predict how much the tree will growth in the 5th year

- b) How tall will the tree be after 10 years?
- c) What is the ultimate height of the tree?

2) A ball is dropped 500ft and it bounces 60% of the distance of the previous fall... How high does the ball bounce after the 7th bounce? How far does a ball travel when it hits the ground for the 10th time?

3) A parent adds 1000 dollars per year into the kid's college fund that pays 3.2% annual compound interest. How much money will be in the account after 18 years?

#### Sequences & Series Test II

Part IV: Miscellaneous

1) Find the 1st five terms and S  $_5$  of the sequence  $a_n = \frac{1}{2^n} \log 1000^n$ 

2) 
$$a_n = \ln(1 \cdot 2 \cdot 3 \cdot ... \cdot n)$$
  
Find  $S_4$ 

3) 
$$t_1 = -40$$
  $r = -3/8$ 

Does this series converge? If so, what value?

Does this series converge? If so, what value?

5) Write 
$$\frac{9 \cdot 8 \cdot 7}{1 \cdot 2 \cdot 3 \cdot 4}$$
 using factorials

$$\frac{12!}{10!4!}$$
 =

$$\frac{(n+1)!}{(n-1)!} =$$

#### Part I: Sequences, Series, and Terms

#### 1) Questions

- What is the arithmetic mean between 10 and 20? 15
- What is the geometric mean between 10 and 20?  $10\sqrt{2}$

#### 2) Write the first 3 terms:

a) arithmetic series; 1st term: 50

common difference: 1.6

50 + 51.6 + 53.2

series is the sum of terms

b) geometric sequence; 1st term: 13

common ratio: 4

13, 52, 208

 $13 \times 4 = 52$ 

$$52 \times 4 = 208$$

3) In a geometric sequence,  $T_3 = 24$   $T_5 = 6$ 

b) What is another possible answer? -12

a) What is  $T_4$ ? 12

"geometric mean"

 $6 \times 24 = 144$ 

since there is one term in between, square

$$\sqrt{144} = 12$$

$$\frac{6}{24} = \frac{1}{4}$$

#### Part II: Sums

Find sum: 1)  $6-3+\frac{3}{2}-\frac{3}{4}+...$ 

common ratio:  $\frac{-3}{6} = \frac{3/2}{-3} = \frac{-3/4}{3/2} = \frac{-1}{2}$   $S_{\infty} = \frac{6}{1 - (-1/2)} = \boxed{4}$ 

$$S_{\infty} = \frac{a_1}{1-r}$$

2)  $1.5 + 4.5 + 13.5 + \dots$ 

since the common ratio is 3 > 0, the series diverges (i.e. goes to infinity)

3) 
$$\sum_{k=1}^{11} 15 \left(\frac{2}{3}\right)^{k} = a_{1} = 10$$

$$r = \frac{2}{3} \qquad 10\left(1 - \left(\frac{2}{3}\right)^{11}\right)$$

$$1 - \frac{2}{3} \approx \frac{10(.9884)}{1/3}$$

$$10, 6.67, 4.44, 2.96, 1.97, \dots \Rightarrow \approx 29.65$$

$$S_n = \frac{a_1(1-r^n)}{1-r}$$

4) 
$$\sum_{k=0}^{20} 100 (1.08)^{k} =$$
 Important: There are 21 terms! (not 20) 
$$r = 1.08 \qquad S_{21} = \frac{100(1 - (1.08)^{21})}{1 - 1.08} = 5042.29$$
 
$$a_{0} = 100 \qquad or, \quad 100 + \frac{108(1 - (1.08)^{20})}{1 - 1.08}$$

5) Find the sum of multiples of 4 between 15 and 523.

First, determine the sequence (i.e. 1st and last terms)...  $a_1 = 16$  and  $a_k = 520$ 

Each multiple will be 4k

$$\frac{520 - 16}{4} = 126 \text{ 'moves' from 1st to last term}$$

$$\sum_{k=1}^{127} 4k + 12 = \frac{127}{2} (16 + 520) = 34,036$$

6) Find the sum of all multiples of 7 including and between 7 and 98.

There are 14 multiples of 7 between 7 and 98...

$$\sum_{k=1}^{14} 7k = 7 + 14 + 21 + \dots + 91 + 98$$

$$105$$

7 pairs 01 105...

 $(105) \times 7 = 735$ 

7) If the sum of the first 14 terms of arithmetic sequence is 301, and the first term is 2, what is the 4th term?

Step 1: Find the last term

$$a_1 = 2$$
14 terms
$$\frac{14(2 + a_{14})}{2} = 301$$

$$2 + a_{14} = 43$$

$$a_{14} = 41$$

Step 2: Find the common difference

$$d = \frac{41 - 2}{13} = 3$$

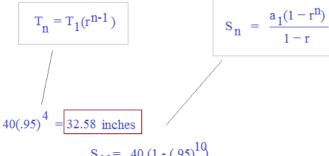

Step 3: Find the 4th term... 2, 5, 8, 11, 14 17...

#### Sequences & Series Test II

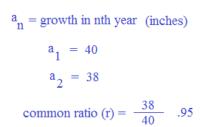

#### SOLUTIONS

Part III: Word Problems & Applications

- A tree grows geometrically. The first year growth was 40 inches. The second year growth was 38 inches.
  - a) Predict how much the tree will growth in the 5th year
  - b) How tall will the tree be after 10 years? 321.01 inches
  - c) What is the ultimate height of the tree? 800 inches

$$S_{10} = \frac{40 (1 - (.95)^{10})}{1 - .95} = 321.01$$

2) A ball is dropped 500ft and it bounces 60% of the distance of the previous fall... How high does the ball bounce after the 7th bounce?  $300(.6)^{n-1} = 14$  (note: the 1st bounce How far does a ball travel when it hits the ground for the 10th time?

> find travel total (up) find travel total (down) 300(1 - .6<sup>9</sup>) (1 - .6)  $\frac{500(1-.6^{10})}{(1-.6)}$ total: 1984.88

> > 1242.44

3) A parent adds 1000 dollars per year into the kid's college fund that pays 3.2% annual compound interest. How much money will be in the account after 18 years?

Step 1: Find the sum formula (sigma notation)

742.44

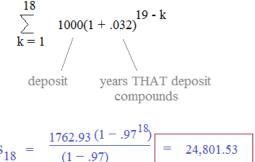

Step 2: Find the first 2 terms a and a to determine the ratio (r)

Step 3: Insert into the partial sum formula

$$a_1 = 1000(1.032)^{18} = 1762.93$$

$$a_2 = 1000(1.032)^{17} = 1708.26$$

$$r = \frac{1708.26}{1762.93} \approx .97$$

 $S_{18} = \frac{1762.93 (1 - .97^{18})}{(1 - .97)}$ Approximate

#### Part IV: Miscellaneous

1) Find the 1st five terms and S<sub>5</sub> of the sequence  $a_n = \frac{1}{2^n} \log 1000^n$ 

First five terms:  $\frac{3}{2} + \frac{3}{2} + \frac{9}{8} + \frac{3}{4} + \frac{15}{32}$ 

 $S_5 = \frac{171}{32}$  (add up the 5 terms)

2)  $a_n = \ln(1 \cdot 2 \cdot 3 \cdot ... \cdot n)$ 

Find  $S_4$ 

$$a_1 = \ln(1)$$

$$a_2 = \ln(2)$$

 $S_4 = 0 + .693 + 1.792 + 3.178$ 

$$a_3 = \ln(6)$$

 $\approx$  5.663

$$a_4 = \ln(24)$$

3)  $t_1 = -40$  r = -3/8

Does this series converge? If so, what value?

since the |-3/8| < 1, it does converge

4)  $-90 + 81 + -72.9 + \dots$ 

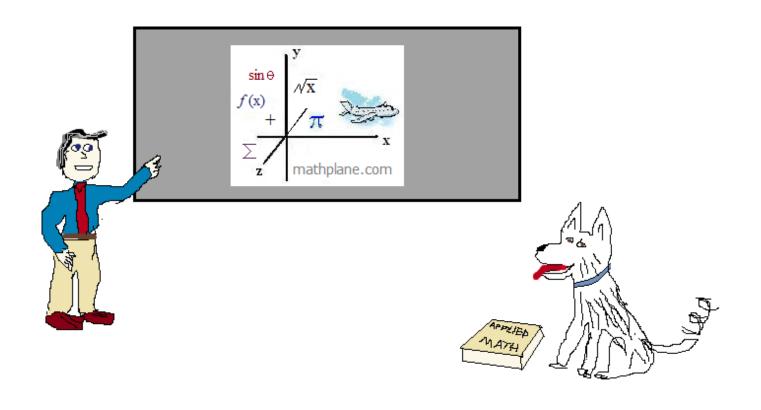

since the common ratio is -.9, it converges

Does this series converge? If so, what value?

5) Write  $\frac{9 \cdot 8 \cdot 7}{1 \cdot 2 \cdot 3 \cdot 4}$  using factorials  $\frac{9!}{6! \cdot 4!}$ 

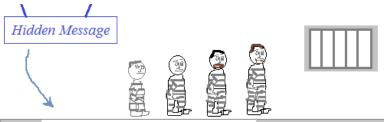

$$\frac{12!}{10!4!} = \frac{12 \cdot 11 \cdot 10!}{10! \cdot 4 \cdot 3 \cdot 2 \cdot 1} = \frac{132}{24} = 5.5$$

$$\frac{(n+1)!}{(n-1)!} = \frac{(n+1)(n)(n-1)(n-2)...}{(n-1)(n-2)...} = n^2 + n$$

Also, at mathplane.ORG for mobile and tablets.

Hint: Ordered lines of prisoners?

#### Letter/Number Key

1 2 3 4 5 6 7 8 9 0 C E G N O R Q S T U

Answer the 12 questions...
Then, convert the numbers into letters to reveal the answer!

- 1) In the arithmetic sequence,  $T_3 = 24$  and  $T_8 = 49$ . What is  $T_{22}$ ?
- 2) What is the geometric mean between 5 and 125?
- 3) What is the next term in the following sequence? 64, -32, 16, -8, ?
- 4) In the following arithmetic sequence, 48 is what term? 99, 96, 93, ...
- 5) What is the common ratio of the following sequence?

$$\frac{1}{12}$$
,  $\frac{1}{6}$ ,  $\frac{1}{3}$ ,  $\frac{2}{3}$ , ...

6) What is the limit to which this geometric series converges?

7) 
$$\sum_{n=3}^{7} n^2 - 3n$$

- 8) What is the 20th partial sum of the following series? First term: -2 Common difference: 4
- 9) In the Fibonacci sequence 2, 3, 5, 8, 13, 21,.. what term is next?
- 10) What is the sum of the first 9 terms of the geometric series? first term: 6561 common ratio: 1/3
- 11) What is the arithmetic mean between -6 and 10?
- 12) In the following (recursive) sequence, identify the 5th term:

$$a_1 = 3$$
 $a_{n+1} = 3a_n + 1$ 

$$7 \bigcirc 0 \rightarrow$$

Hint: Ordered lines of prisoners?

#### Letter/Number Key

3 4 5 6 CEGNORQSTU

Answer the 12 questions... Then, convert the numbers into letters to reveal the answer!

1) In the arithmetic sequence, 
$$T_3 = 24$$
 and  $T_8 = 49$ .

What is  $T_{22}$ ?

 $a_n = a_1 + (n-1)d$ 

2) What is the geometric mean between 5 and 125?

 $5 \cdot 125 = 625$  then,  $\sqrt{625} = \boxed{25}$ 

to reverted the sequence of the prisoners?

$$\begin{array}{c}
\text{common difference} \\
d = \frac{49 \cdot 24}{5} = 5 \\
T_{22} = 14 + (22 \cdot 1)(5) = \boxed{119}
\end{array}$$

$$d = \frac{15 - 27}{5} = 5$$

$$T_{22} = 14 + (22 - 1)(5) = 119$$

$$5 \cdot 125 = 625$$
 then,  $\sqrt{625} = 25$ 

3) What is the next term in the following sequence?

4) In the following arithmetic sequence, 48 is what term?

$$T_3 = 93$$

$$T_3 = 93$$
  
 $48 - 93 = -45$ 
 $-45 = 15$  "moves" 1 8

$$1 \boxed{8} \rightarrow \underline{S}$$

5) What is the common ratio of the following sequence?

$$\frac{1}{12}$$
,  $\frac{1}{6}$ ,  $\frac{1}{3}$ ,  $\frac{2}{3}$ , ...  $\frac{1/6}{1/12} = 2$   $\frac{2/3}{1/3} = 2$ 

$$2 \rightarrow E$$

What is the limit to which this geometric series converges?

common ratio 
$$r = \frac{1}{2}$$

common ratio 
$$r = \frac{1}{2}$$
  $38 + 19 + 9.5 + ...$   $S_{\infty} = \frac{T_1}{1 - r} = \frac{38}{1/2} = 76$ 

$$\begin{bmatrix} 7 \end{bmatrix} 6 \rightarrow Q$$

7) 
$$\sum_{n=3}^{7} n^2 - 3n$$
 3: 4: 5: 6: 7:  $(9-9) = 0$   $(16-12) = 4$   $(25-15) = 10$   $(36-18) = 18$   $(49-21) = 28$   $0+4+10+18+28 = 60$ 

$$6\boxed{0} \longrightarrow \boxed{U}$$

8) What is the 20th partial sum of the following series? First term: -2 Common difference: 4

First term: 
$$-2$$
 Common difference: 4 first, find the 20th term:  $T_{20} = -2 + (20 - 1)(4) = 74$ 

$$-2 + 2 + 6 + \frac{72}{72} + 66 + 70 + 74$$

$$72 \quad 72 \times (10 \text{ pairs}) =$$

$$7 \boxed{2} 0 \rightarrow E$$

9) In the Fibonacci sequence 2, 3, 5, 8, 13, 21,... what term is next? 2 + 3 = 5... 3 + 5 = 8... 8 + 13 = 21... etc... 13 + 21 = 34

$$3 \boxed{4} \rightarrow N$$

10) What is the sum of the first 9 terms of the geometric series?

first term: 6561 common ratio: 
$$1/3$$

$$\frac{1 - (1/3)^9}{1 - (1/3)} = 9841$$

first term: 6561 common ratio: 1/3  $S_n = \langle a_1 \rangle \frac{1-r^n}{1-r}$   $S_9 = (6561) \frac{1-(1/3)^9}{1-(1/3)} = \boxed{9841}$ 11) What is the arithmetic mean between -6 and 10?  $\frac{-6+10}{2} = 2$  +8 +8 -6, 2, 10

$$\frac{6+10}{2} = 2$$
  $\frac{+8}{-6}, \frac{+8}{2}, \frac{+8}{10}$ 

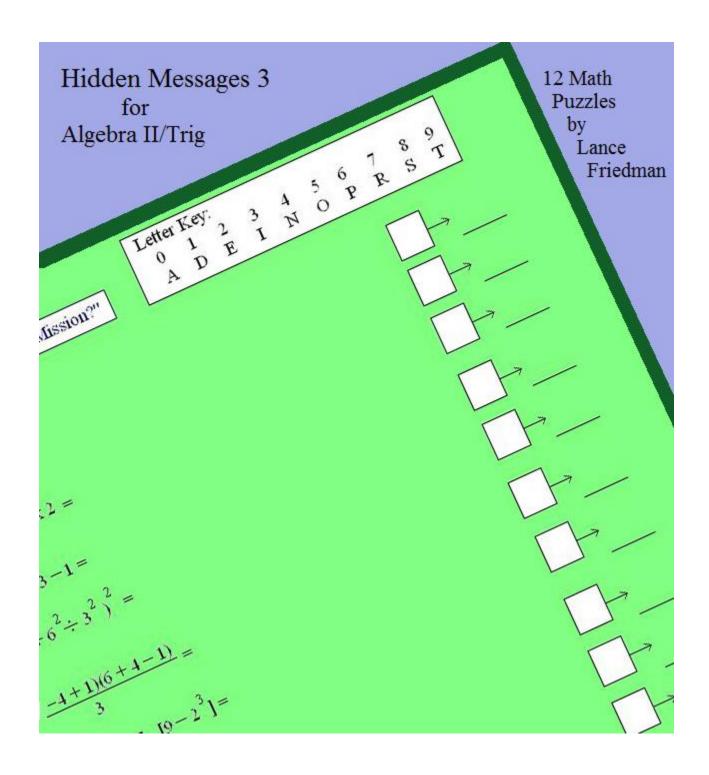

$$2 \rightarrow E$$

In the following (recursive) sequence, identify the 5th term: 12)

$$a_1 = 3$$
  $a_1 = 3$   $a_2 = 3(10) + 1 = 31$   $a_1 = 3$   $a_2 = 3(3) + 1 = 10$   $a_4 = 3(31) + 1 = 94$   $a_5 = 3(94) + 1 = 283$ 

$$2 \boxed{8} 3 \rightarrow S$$
